

## PROJECT ABSTRACT

# Blockchain-Based NGO Donation Tracker

A Blockchain-Based Milestone Verification System for Transparent Charitable Fund Disbursement

| Project Type     | Major Project                                                        |
| Key Technologies | Solidity, Ethereum/Polygon, IPFS, GPS Metadata Verification, Web3.js |

## Abstract

Charitable giving suffers from a persistent trust deficit: once a donor transfers funds to an NGO, they have little visibility into how, when, or whether that money is actually used for its intended purpose. Traditional accountability mechanisms — annual reports, third-party audits, and self-published statements — are retrospective, infrequent, and easily manipulated, leaving donors to rely on blind faith rather than verifiable evidence.

This project proposes a Blockchain-Based Transparent NGO Donation Tracker, a decentralized application that replaces blind trust with programmable, stage-wise accountability. Instead of releasing the entire donated amount at once, funds are locked in a smart contract and disbursed in predefined tranches. Each tranche is unlocked only after the NGO submits verifiable proof of work completed — photographs, receipts, and GPS-tagged evidence — which is then reviewed and approved through a decentralized voting mechanism carried out by a group of stakeholders, such as fellow donors, auditors, or community-elected verifiers.

This shifts the fundamental question donors ask from an unanswerable “where did my money go?” to a transparent, on-chain, and independently verifiable answer. Unlike generic “put the transaction on blockchain” proposals that only make the transfer of money transparent, this system verifies the actual on-ground utilization of funds at every stage, offering a practical, extensible, and socially meaningful application of blockchain, decentralized storage, and DAO governance to a real-world problem in charitable giving.
